LANIER, BENJAMIN E

ART UNIT PAPER NUMBER

2132

DATE MAILED: 07/19/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/844,246

Applicant(s)

AUDEBERT ET AL.

Examiner

Benjamin E Lanier

Art Unit

2132

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 22 June 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-7,9,10 and 15-42 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-7,9,10 and 15-42 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

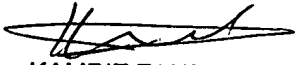

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 31 July 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

  
KAMBIZ ZAND

## DETAILED ACTION

### *Response to Arguments*

1. Applicant's arguments filed 22 June 2006 have been fully considered but they are not persuasive. Applicant's argument that DiGiorgio does not disclose a communication section that communicates message packets over a network using a packet based communication protocol is not persuasive because DiGiorgio discloses that the computer system containing the reader (Figure 1) communicates with a remote server computer system via a communication link (Col. 5, lines 50-51). The communication link being an Internet connection (Col. 5, lines 55-57), which meets the limitation of packet based communication protocol. The claims recite "a client communications section", which does not limit the claims to a **singular** specific piece of hardware that must provide packet based communications over a network **and** a smart card interface. Using a broad but reasonable interpretation of "a client communications section", the communication interfaces of the computer system in DiGiorgio meets the claim limitations.

2. Applicant alleges that the Office Action mailed 28 March 2006 recognizes that DiGiorgio fails to disclose claimed elements of claim 1. These arguments are not persuasive because the above mentioned Office Action has detailed specifically how DiGiorgio expressly and inherently meets every single limitation.

3. Applicant has correlated the reader of DiGiorgio to the claimed local client, which is not persuasive because the computer system (Figure 1, element 14) of DiGiorgio meets the claimed local client. The reader coupled to the computer system of DiGiorgio meets the claimed PSD interface.

Art Unit: 2132

4. Applicant repeats arguments with respect to the reader not being a network interface.

These arguments have been fully addressed above.

*Claim Rejections - 35 USC § 102*

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

6. Claims 1-7, 9, 10, 15-17, 19-42 are rejected under 35 U.S.C. 102(e) as being anticipated by DiGiorgio, U.S. Patent No. 6,385,729. Referring to claims 1, 42, DiGiorgio discloses a secure token device access system wherein a secure token device and a local computer system communicate via a token reader, and by passing data packages known as application protocol data units (APDUs) using the reader (Col. 1, line 63 – Col. 2, line 13 & Col. 9, lines 1-6), which meets the limitation of client communications means for transmitting and receiving message packets over said network using a packet based communications protocol, and for transmitting and receiving APDUs through said PSD interface. When a user attempts to access ISP services from the token device, the ISP issues a challenge to the token device to ensure that the user should be granted access to the ISP services (Col. 2, lines 16-23 & Col. 10, lines 24-33), which meets the limitation of a first client data processing means for receiving incoming message packets from said remote computer system using said client communications means, separating encapsulated APDUs from said incoming message packets thus generating desencapsulated APDUs and routing said desencapsulated APDUs to said PSD through said PSD Interface

Art Unit: 2132

independently of the origin and integrity of said incoming message packets. Once the challenge is received at the token device, the token device issues a response to the ISP challenge in the form shown in Figure 8B (Col. 10, lines 33-35), which meets the limitation of second client data processing means for receiving incoming APDUs from said PSD interface, encapsulating said incoming APDUs into outgoing message packets and routing said outgoing message packets to said remote computer system through said client communications means.

Referring to claim 2, DiGiorgio discloses a secure token device access system wherein a secure token device and a local computer system communicate via a token reader, and by passing data packages known as application protocol data units (APDUs) using the reader (Col. 1, line 63 – Col. 2, line 13 & Col. 9, lines 1-6), which meets the limitation of at least one PSD comprising means for functionally connecting to said PSD interface and means for functionally communicating through said interface, PSD communications means for transmitting and receiving APDU messages through said PSD interface. When a user attempts to access ISP services from the token device, the ISP issues a challenge to the token device to ensure that the user should be granted access to the ISP services (Col. 2, lines 16-23 & Col. 10, lines 24-33), which meets the limitation of PSD processing means for interpreting said APDU messages, executing commands included in said APDU messages. Once the challenge is received at the token device, the token device issues a response to the ISP challenge in the form shown in Figure 8B (Col. 10, lines 33-35), which meets the limitation of transmitting responses in APDU format through said PSD interface using said communications means. The secure token device contains a unique ID that is encoded into the token device (Col. 10, lines 54-55), which meets the limitation of memory storage means for storing at least one unique identifier.

Referring to claim 3, DiGiorgio discloses that when a user attempts to access ISP services from the token device, the ISP issues a challenge to the token device to ensure that the user should be granted access to the ISP services (Col. 2, lines 16-23 & Col. 10, lines 24-33), which meets the limitation of server communications means for transmitting and receiving messages over said network using said packet based communications protocol, first server data processing means for receiving requests from at least one applications level program, translating said requests into APDU format and transmitting said APDU formatted requests to a second server data processing means, second server data processing means for encapsulating said APDU formatted requests received from said first server data processing means into outgoing message packets and transmitting said outgoing message packets over said network to said local client using said server communications means. Once the challenge is received at the token device, the token device issues a response to the ISP challenge in the form shown in Figure 8B (Col. 10, lines 33-35), which meets the limitation of third server data processing means for receiving incoming messages from said local client using said server communications means and separating encapsulated APDUs from said incoming message packets thus generating desencapsulated APDUs and routing said desencapsulated APDUs to a fourth server data processing means, and fourth server data processing means for receiving and translating said desencapsulated APDUs sent by said third server data processing means into another message format thus generating a translated message and transmitting said translated message to at least one applications level program.

Referring to claim 4, DiGiorgio discloses that the network can be the Internet (Col. 1, lines 19-20), which meets the limitation of a public network.

Referring to claim 5, DiGiorgio discloses that the network can be a LAN (Col. 7, lines 28-29), which meets the limitation of a private network.

Referring to claim 6, DiGiorgio discloses that the communications protocol is the Internet Protocol (Col. 1, lines 38-39), which meets the limitation of an open communications protocol.

Referring to claim 7, DiGiorgio discloses that the communications can be encrypted (Col. 11, lines 21-25), which meets the limitation of a secure communications protocol.

Referring to claim 9, DiGiorgio discloses a secure token device access system wherein a secure token device and a local computer system communicate via a token reader, and by passing data packages known as application protocol data units (APDUs) using the reader (Col. 1, line 63 – Col. 2, line 13 & Col. 9, lines 1-6), which meets the limitation of PSD communications means for transmitting and receiving encrypted APDU messages through said PSD interface. When a user attempts to access ISP services from the token device, the ISP issues a challenge to the token device to ensure that the user should be granted access to the ISP services (Col. 2, lines 16-23 & Col. 10, lines 24-33). The computer system utilizes Netscape Navigator, which includes SSL capabilities and would therefore enable two way encrypted communications (Col. 7, lines 44-47), which meets the limitation of first PSD processing means for decrypting incoming encrypted APDU messages using stored cryptographic information, thus generating incoming decrypted APDU messages, second PSD processing means for interpreting said incoming decrypted APDU messages, and executing commands included in said incoming decrypted APDU messages, third PSD processing means for encrypting outgoing APDU response messages using stored cryptographic information thus generating outgoing encrypted APDU response messages, and transmitting said outgoing encrypted APDU response messages in said

Art Unit: 2132

APDU format through said PSD interface using said communications means, means for storing at least one cryptographic key. The secure token device contains a unique ID that is encoded into the token device (Col. 10, lines 54-55), which meets the limitation of memory storage means for storing at least one unique identifier.

Referring to claims 10, 15, DiGiorgio discloses a secure token device access system wherein a secure token device and a local computer system communicate via a token reader, and by passing data packages known as application protocol data units (APDUs) using the reader (Col. 1, line 63 – Col. 2, line 13 & Col. 9, lines 1-6), which meets the limitation of server communications means for transmitting and receiving messages over said network using said packet based communications protocol. Once the challenge is received at the token device, the token device issues a response to the ISP challenge in the form shown in Figure 8B (Col. 10, lines 33-35). The computer system utilizes Netscape Navigator, which includes SSL capabilities and would therefore enable two way encrypted communications (Col. 7, lines 44-47), which meets the limitation of cryptography data processing means, first server data processing means for receiving requests from at least one applications level program, translating said requests into APDU format and transmitting said APDU formatted requests to said cryptography data processing means, second server data processing means for encapsulating encrypted APDU formatted requests received from said cryptography data processing means into outgoing message packets transmitting said outgoing message packets over said network using said server communications means, third server data processing means for receiving incoming message packets using said server communications means and separating encapsulated APDUs from said incoming message packets thus generating desencapsulated APDUs and routing said

Art Unit: 2132

desencapsulated APDUs to said cryptography data processing means, fourth server data processing means for receiving and translating decrypted desencapsulated APDUs send by said cryptography processing means into another message format thus generating a translated message and transmitting said translated message to at least one applications level program, wherein said cryptography data processing means comprises means for encrypting said APDU formatted requests received from said first server data processing means and sending said encrypted APDU formatted requests to said second server data processing means and for decrypting said desencapsulated APDUs received from said third server data processing means and sending said decrypted desencapsulated APDUs to said fourth server data processing means.

Referring to claims 16, 17, 19, DiGiorgio discloses that the network can be a cellular network (Col. 5, line 39), which meets the limitation of a digital cellular network and a wireless network.

Referring to claims 20, 28, 37, DiGiorgio discloses a secure token device access system wherein a secure token device and a local computer system communicate via a token reader, and by passing data packages known as application protocol data units (APDUs) using the reader (Col. 1, line 63 – Col. 2, line 13 & Col. 9, lines 1-6), which meets the limitation of generating a request to access said PSD on said remote computer system, wherein said request is in a non-native protocol for communicating with said PSD and said request is generated by an API level program, converting on said remote computer system said request from said non-native protocol into an APDU format request message using a first server data processing means. When a user attempts to access ISP services from the token device, the ISP issues a challenge to the token device to ensure that the user should be granted access to the ISP services (Col. 2, lines 16-23 &

Art Unit: 2132

Col. 10, lines 24-33), which meets the limitation of encapsulating on said remote computer system said APDU format request message into said packet based communications protocol producing an encapsulated request message, using a second server data processing means, transmitting said encapsulated request message over said network using said packet based communications protocol. Once the challenge is received at the token device, the token device issues a response to the ISP challenge in the form shown in Figure 8B (Col. 10, lines 33-35), which meets the limitation of receiving by said client said encapsulated request message sent over said network, processing said encapsulated request message using a first data processing means to separate said APDU format request message from said encapsulated request message, routing on said client said APDU format request message through a hardware device port assigned to a PSD interface independently of the origin and integrity of said encapsulated request message, wherein said PSD interface is in processing communication with said PSD, receiving by said PSD said APDU format request message through said PSD interface and processing said APDU format response message into said packet based communications protocol producing an encapsulated response message, using a second data processing means, transmitting said encapsulated response message over said network using said packet based communications protocol, receiving said encapsulated response message sent over said network by said remote computer system, processing said encapsulated response message using a third server data processing means to separate said APDU response message from said encapsulated response message thus generating a desencapsulated APDU response message, converting by said remote computer system said desencapsulated APDU response message into a response in a non-native

protocol using a fourth server data processing means and forwarding said response to at least one API level program.

Referring to claim 21, DiGiorgio discloses that the network can be the Internet (Col. 1, lines 19-20), which meets the limitation of a public network.

Referring to claim 22, DiGiorgio discloses that the network can be a LAN (Col. 7, lines 28-29), which meets the limitation of a private network.

Referring to claim 23, DiGiorgio discloses that the communications protocol is the Internet Protocol (Col. 1, lines 38-39), which meets the limitation of an open communications protocol.

Referring to claim 24, DiGiorgio discloses that the communications can be encrypted (Col. 11, lines 21-25), which meets the limitation of a secure communications protocol.

Referring to claim 25, DiGiorgio discloses that system may automatically attempt to grant the user access to the ISP services once the token device is authenticated (Col. 10, lines 24-28), which meets the limitation of said communication pipe is initiated automatically upon connection of said PSD to said local client.

Referring to claims 26, 27, DiGiorgio discloses that the access to the ISP services may be granted upon a user double click on an icon associated with the ISP (Col. 10, lines 24-26), which meets the limitation of said communications pipe is initiated by a client requesting access to information contained on one or more networked clients or networked remote computer systems.

Referring to claims 29, 36, 37, DiGiorgio discloses a secure token device access system wherein a secure token device and a local computer system communicate via a token reader, and by passing data packages known as application protocol data units (APDUs) using the reader

Art Unit: 2132

(Col. 1, line 63 – Col. 2, line 13 & Col. 9, lines 1-6), which meets the limitation of generating a request to access said PSD on said remote computer system, wherein said request is in a non-native protocol for communicating with said PSD and said request is generated by an API level program, converting on said remote computer system said request from said non-native protocol into an APDU format request message using a first server data processing means, and sending said APDU format request message to a cryptography data processing means. When a user attempts to access ISP services from the token device, the ISP issues a challenge to the token device to ensure that the user should be granted access to the ISP services (Col. 2, lines 16-23 & Col. 10, lines 24-33). The computer system utilizes Netscape Navigator, which includes SSL capabilities and would therefore enable two way encrypted communications (Col. 7, lines 44-47), which meets the limitation of receiving and encrypting said APDU format request message using cryptography data processing means thus generating an encrypted APDU request message and sending said encrypted APDU request message to a second server data processing means, wherein said cryptography data processing means uses a pre-established encryption method, encapsulating on said remote computer system said encrypted APDU request message into said packet based communications protocol producing an encapsulated and encrypted request message, using said second server data processing means, transmitting said encapsulated and encrypted request message over said network using said packet based communications protocol. Once the challenge is received at the token device, the token device issues a response to the ISP challenge in the form shown in Figure 8B (Col. 10, lines 33-35), which meets the limitation of receiving said encapsulated and encrypted request message sent over said network by said client, processing said encapsulated and encrypted request message using a first client data processing

Art Unit: 2132

means to separate said encrypted APDU request message from said encapsulated and encrypted request message thus generating a desencapsulated encrypted APDU request message, routing on said client said desencapsulated encrypted APDU request message through a hardware device port assigned to a PSD interface independently of the origin and integrity of said encapsulated and encrypted request message, wherein said PSD interface is in processing communication with said PSD, receiving said desencapsulated encrypted APDU request message through said PSD interface by said PSD and decrypting said desencapsulated encrypted APDU request message using an internal PSD data cryptography means thus generating a desencapsulated and decrypted APDU request message, wherein said cryptography means is pre-established and sending said desencapsulated and decrypted APDU request messages to a first internal PSD data processing means, receiving said desencapsulated and decrypted APDU request message from said internal PSD data cryptography means and processing said desencapsulated and decrypted APDU request message using said first internal PSD data processing means, generating a response message in APDU format by said PSD using a second internal PSD data processing means, encrypting said APDU format response message using said internal PSD data cryptography means thus generating an encrypted APDU format response message response message through said PSD interface, and transmitting said encrypted APDU format receiving by said client said encrypted APDU format response message through said PSD Interface and encapsulating said encrypted APDU format response message into said packet based communications protocol producing an encapsulated and encrypted response message, using a second client data processing means, transmitting said encapsulated message over said network using and encrypted response said packet based communications protocol, receiving by said remote computer system said

Art Unit: 2132

encapsulated and encrypted response message sent over said network, processing said encapsulated and encrypted response message using a third server data processing means to separate said encrypted APDU response message from said encapsulated and encrypted response message thus generating a desencapsulated encrypted APDU response message, decrypting said desencapsulated encrypted APDU response server data processing means message received from said third using said cryptography data processing means thus generating a desencapsulated and decrypted APDU response message and sending said desencapsulated and decrypted APDU response message to said fourth server data processing means, and converting by said remote computer system said desencapsulated and decrypted APDU response message into a response in a non-native protocol using a fourth server data processing means, and forwarding said response to at least one API Level Program.

Referring to claim 30, DiGiorgio discloses that the network can be the Internet (Col. 1, lines 19-20), which meets the limitation of a public network.

Referring to claim 31, DiGiorgio discloses that the network can be a LAN (Col. 7, lines 28-29), which meets the limitation of a private network.

Referring to claim 32, DiGiorgio discloses that the communications protocol is the Internet Protocol (Col. 1, lines 38-39), which meets the limitation of an open communications protocol.

Referring to claim 33, DiGiorgio discloses that the communications can be encrypted (Col. 11, lines 21-25), which meets the limitation of a secure communications protocol.

Referring to claims 34, 35, DiGiorgio discloses that the access to the ISP services may be granted upon a user double click on an icon associated with the ISP (Col. 10, lines 24-26), which

Art Unit: 2132

meets the limitation of said communications pipe is initiated by a client requesting access to information contained on one or more networked clients or networked remote computer systems.

Referring to claims 38, 39, 41, DiGiorgio discloses that the network can be a cellular network (Col. 5, line 39), which meets the limitation of a digital cellular network and a wireless network.

***Claim Rejections - 35 USC § 103***

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

9. Claims 18, 40 are rejected under 35 U.S.C. 103(a) as being unpatentable over DiGiorgio, U.S. Patent No. 6,385,729, in view of Brown, U.S. Patent No. 5,455,863. Referring to claims 18, 40, DiGiorgio does not disclose that the network can be optical. Brown discloses a network authentication system wherein the network is wireline, optical fiber link, satellite, or any other type of communication channel (Col. 8, lines 56-58). It would have been obvious to one of ordinary skill in the art at the time the invention was made for the network of Chan to be optical

Art Unit: 2132

because Brown discloses that those skilled in the art would understand that different networks can be used without departing from the spirit and scope of the invention (Col. 8, lines 48-55).

### ***Double Patenting***

10. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

11. A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

12. Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

13. Claims 1-42 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-4, 7-10, 13-15 of copending Application No. 09/844,439, '439 application. Although the conflicting claims are not identical, they are not patentably distinct from each other because both applications claim methods and systems for transmitting message packets, by a remote computer system, with

Art Unit: 2132

encapsulated APDUs over a communication path to a local client that desencapsulates the message packets before routing the APDUs to the PSD. The PSD then routes APDUs to the local client for encapsulation and transmission to the remote computer system. The methods and systems containing encrypted and unencrypted embodiments. Therefore claims 1-42 of the current application are anticipated in claims 1-4, 7-10, 13-15 of the '439 application.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

The double patenting rejection is response to amendments to the claims in the '439 application that were filed 19 April 2005.

### ***Conclusion***

14. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

15. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Benjamin E. Lanier whose telephone number is 571-272-3805.

The examiner can normally be reached on M-Th 7:30am-5:00pm, F 7:30am-4pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on 571-272-3799. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
